## Background

The objective of this study was to assess the availability and prices of essential medicines for chronic diseases in 11 countries, namely China, Fiji, India, Indonesia, Lao, Malaysia, Mongolia, the Philippines, Sri Lanka, Thailand and Vietnam. The study was carried out at an international level.

The median availability of any medicine (IB or LPG) in the public sector was 35.5% compared to 56.7% in the private sector. Thailand and Indonesia had the highest levels of availability in the public sector (80% and 60.1% respectively) while in the private sector it was India and Fiji (90% and 83.4% respectively).

Countries in the Region paid 1.4 times the international reference price (IRP) to procure LPGs and 9.1 times the price for IBs.

India and Fiji achieved low procurement prices (0.4 and 0.6 times IRP for LPGs) while the Philippines had the highest procurement prices for both IBs and LPGs.

In general, patient prices were lower in the public sector than in the private sector (21.5 times IRP vs 32.2 times for IBs and 6.6 times vs 11.5 times for LPGs).

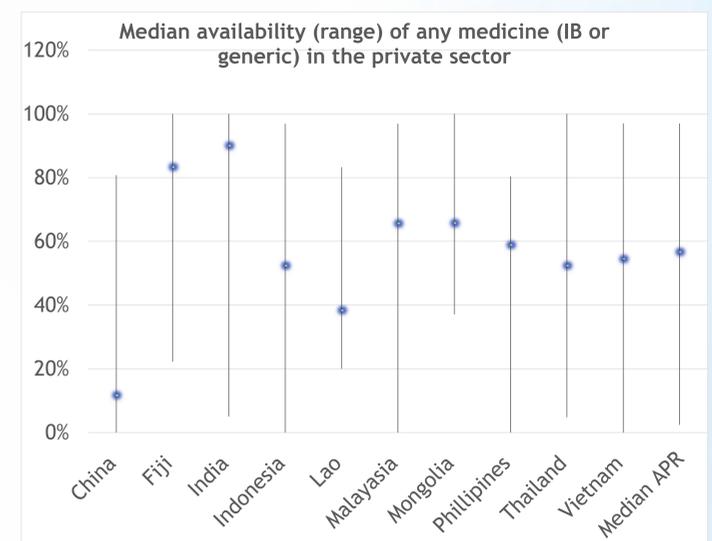

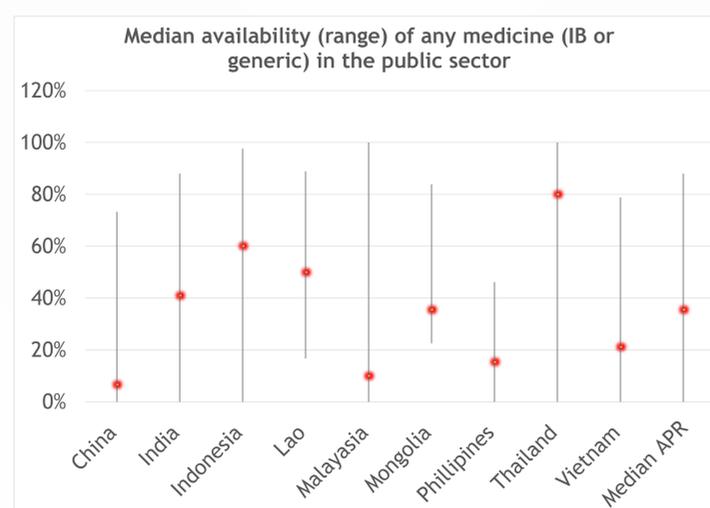

In the public sector, Malaysia and India provided medicines free of charge while the Philippines charged the highest price.

## Methods

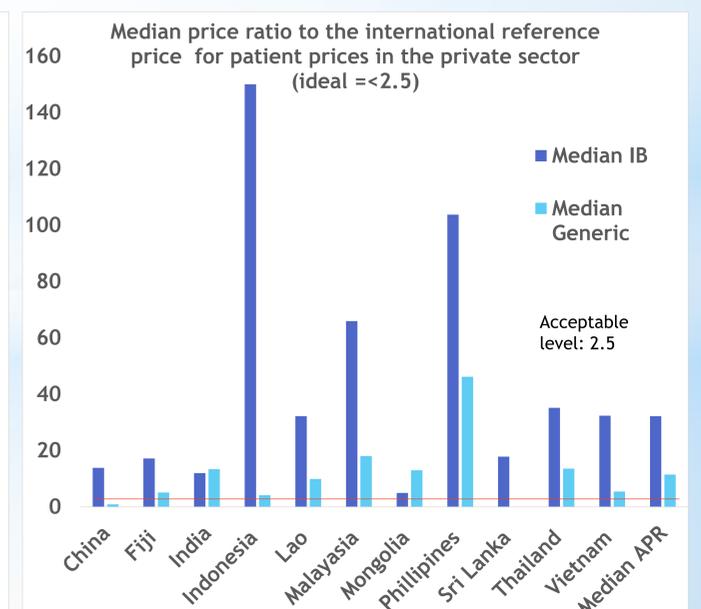

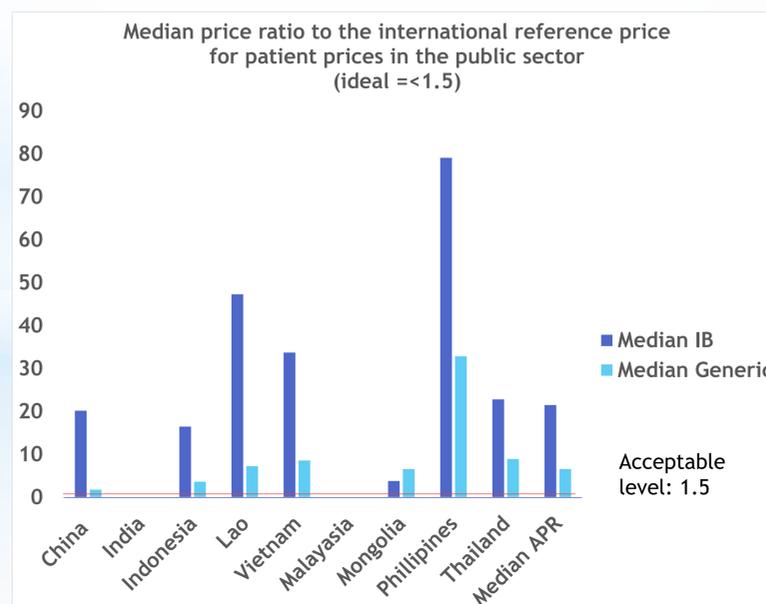

Data on the availability and price of 15 medicines used for chronic diseases prevalent in the older population were obtained from facility-based surveys conducted in 11 countries between 2001 and 2013 (Health Action International's database on medicine prices).

Prices were converted into the base year of 2014. Patient prices were adjusted for inflation and purchasing power parity and procurement prices for inflation and official exchange rates. Data were analysed for lowest priced generic (LPG) and innovator brand (IB) products in both the public and private sectors.

## Results: availability

## Results: prices

## Conclusions

The availability and prices of medicines for chronic conditions were highly variable across the Asia Pacific Region. Medicines were more available in the private sector, but at an excessive price. Implementation of policies to improve the availability and reduce the prices of essential medicines for chronic diseases is needed.
